Escherichia coli CsgB DNA sequence SEQ ID NO:4.

```
Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                             WPI; 2000-672631/65.

```

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbria subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombination of a recombinant gene back into the chromosome of the homologous species; (3) directing recombination of a recombination of the native

CC comprising separating an amino acid polymer comprising a recombinant AgfA CC protein containing a replacement segment or segments of foreign amino CC acid sequence or sequences grown on a Salmonella, E. coli or Riterobacteriaceae host cell, from the host cell and introducing the CC quiteful for the animal in conjunction with a carrier or diluent. (I) is CC quiteful for the expression of recombinant AgfA protein which is useful for CC golymer into the minume response in an animal. In a fimbrial presentation CC golymer the heterologous antigens are presented in high numbers (up to CC golymer the heterologous antigens are presented in high numbers (up to comples/cell), the hybrid fimbrin protein possesses both the cracine, the carrier fimbrial proteins are usually strong consines the inserted epitope, and hybrid fimbriae are usually strong consines the inserted epitope, and hybrid fimbriae are easy and the exemplification of the present invention
                                                                                                                                                                                                                 Salmonella, agfA, chromosomal gene replacement, fimbrin, epitope, vaccine; immune response; immunogen, ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a recombinant agfA gene (I) where a CC sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SERIT/TAP) nucleation depended CC assembly system of strains of Salmonella, Escherichia coli and CC AgfA, CsgA and AgfA-homologue fimbria (SERIT/TAP) nucleation depended CC AgfA, CsgA and AgfA-homologue fimbria subunits, respectively; (2) directing recombinant of a recombinant gene into the chromosome of the comprising recombinant coli and CC comprising separating an amino acid polymer comprising a recombinant gene comprising separating an amino acid polymer comprising a recombinant or segments or sequences grown on a Salmonella, E. coli or polymer into the expression of recombinant agfA protein described host cell, from the host cell and introducing the native colymer into the expression of recombinant segments of foreign amino complements of segments of foreign amino complements of the expression of recombinant agfA protein which is useful for system the heterologous antigens are presented in high numbers (up to comprise the instruction properties relevant for an efficient live component the carrier fimbrial subunit proteins are usually strong communogenicity and adhesion properties relevant for an efficient live communogens, which may be important for directing an immune response communogens, which may be important for directing an immune response communogens of the protein possesses both the community in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
